

INLAY

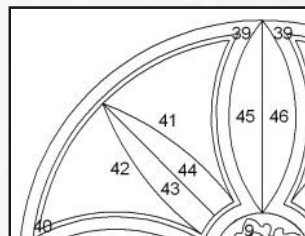

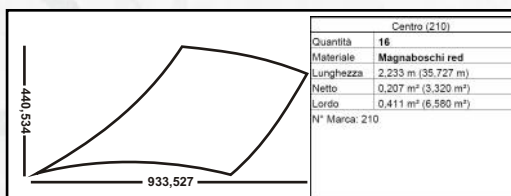

Inlay is a special Logotag function used to manage equal geometries by identifying them automatically and applying the number to be processed for each one. It breaks up the overall drawing into the different parts to be processed, automatically generating the basic specifications of equal geometric profiles and storing the files required to machine them.

The assignment of material textures gives an immediate preview of Florentine mosaics for the rapid design and rendering of inlaywork on marble and ceramics.

A single window manages all the cad parameters (tolerances, background colour, autosave, profile control tolerances, etc.)

Applied to complex artistic designs, it considerably simplifies the handling and storage of parts. A material can also be assigned to each part or set of parts, with rendering on the screen or in a printout including the list of profiles divided by geometry and material.
